IMPORTANT NOTIFICATION

International application No. PCT/US 03/07353

International filing date (day/month/year) 11.03.2003

Priority date (day/month/year)

12.03.2002

E.I. DUPONT DE NEMOURS AND COMPANY

- The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
- A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
- Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

The applicant's attention is drawn to Article 33(5), which provides that the criteria of novelty, inventive step and industrial applicability described in Article 33(2) to (4) merely serve the purposes of international preliminary examination and that "any Contracting State may apply additional or different criteria for the purposes of deciding whether, in that State, the claimed inventions is patentable or not" (see also Article 27(5)). Such additional criteria may relate, for example, to exemptions from patentability, requirements for enabling disclosure, clarity and support for the claims.

Re Item V

Reasoned statement with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1. Reference is made to the following documents:

D1: EP-A-0102502 D2: EP-A-0635538 D3: US-A-4696971 D4: EP-A-0185796

- 2.1 The application concerns a curved laminated article (claim 1) which can be prepared in a conventional process using a vacuum bag (claim 8). The interlayer of this article comprises polyvinylbutyral (PVB) which has a hydroxyl number 15 to 25 and which comprises a plasticizer in an amount less than 30 parts per hundred, a surfactant and opt. an antioxidant and/or bleaching agent. The interlayer is characterized in that it was obtained after extrusion at 225° to 245° C and has yellowness index of less than 12.
- 2.2 Relative features such as "small laminate" and "high" curvature cannot be taken into account when assessing compliance with the requirements of Art. 33(1) PCT. In the light of the intended use of the laminate structure as aircraft windscreen, these quantitative features are even misleading.
- 2.3 The decisive feature of the invention resides in the use of a particular surfactant, namely dioctyl sulfosuccinate (sold under tradenames such as Geropon, Pelex, Aerosol OT-100, Drewfax).

Art. 33(2) and (3) PCT

- 3.1 No objections are raised under Art. 33(2) PCT.
- 3.2 The subject-matter of claims 1, 3, and 5 to 7 lacks an inventive step over the combined teaching of D1 and D2.
 Example 1 of D1 reports on extrusion of a PVB comprising 21 wt.-% of vinyl alcohol units (which determines the hydroxyl number given the definition in ASTM D1396) in the presence of 29 wt.-% (with respect to the total PVB and plasticizer, i.e., about 41 pph) of plasticizer at a maximum temperature of 235° C.
 The resulting yellowness index is 5.

The presence of a surfactant is not explicitly mentioned in D1. However, bearing in

mind the preparation steps of PVB, presence of a surfactant is likely.

3.3 D2 deals with PVB films having improved optical properties and reduced yellowing, too (p.2, col.2, Il.35-43). The ranges for the amounts of plasticizer (preferably 23 to 30 wt.-% of the entire PVB film; col.4, Il.32-36) and the hydroxyl number of the PVB (17 to 29 wt.-%; col.4, Il.1-10) include the amounts employed in Example 1 of D1. In Examples 1 to 5, the plasticizer was triethylene glycol dihexanoate, whereas triethylene glycol dihexanoate was employed in Example 1 of D1. The amount of plasticizer in these Examples of D2 corresponds to 35 pph.

D2 further suggests the use of laminates prepared from the disclosed PVB interlayer in aircraft (p.4, col.5, II.16-24). If the plasticized PVB disclosed in D2 is suitable as an interlayer in laminated

If the plasticized PVB disclosed in D2 is suitable as an interlayer in laminated aircraft windows (requirement of claim 7 of the present application), this lends itself to the conclusion that it is also capable of forming a curved article (feature of present claim 1).

3.3 Claim 1 of the present set of claims restricts the amount of plasticizer to less than about 30 pph.

In Example 1 of the present application, the amount of plasticizer appears to have been 35 pph - see page 16, lines 26 to 28 - and apparently is not decisive for attaining low yellowness index.

As can be seen from comparison of Examples 1 and 2, the effect of reducing the amount of plasticizer 3GO (triethylene glycol di(2-ethylhexanoate)) to 20 pph on yellowness index is present (reduction from 5.85 to 5.05), but the impact on yellowness owing to the choice of the surfactant is much higher as indicated by Comparative Example 1 (increase from 5.85 to 25.05 when replacing dioctyl sodium sulfosuccinate by sodium lauryl sulfate).

Reducing the amount of 3GO plasticizer to 24 pph when using sodium lauryl sulfate even worsens the result as demonstrated by Comparative Example C2 (provided that this was not caused by the potassium salt - see below).

- 3.4 The basic teaching of D1 is to add a phosphite ester in order to reduce yellowing of PVB in the presence of alkaline salts such as potassium acetate see page 1, lines 21 to 24 and top of page 2.
 Melt temperature upon extrusion in the Examples of D1 is at most 235° C in Example 1 and 200° or 210° C in Examples 3 and 4, respectively.
- 3.5 D2 has the same object of reduced yellowing and as D1 points to potassium salts as a possible source of yellowing (p.2, col.1, II.27-36).

 Melt temperature is 200° C in Examples 1 to 5 (p.4, col.6, II.3-7)

Thus, having regard to a melt temperature of 210° to 215° C at the slot die in present Example 1, no fundamental difference can be detected. If these features of the interlayer characterize the claimed laminate, then the subject-matter of claims 1, 3, and 5 to 7 is obvious in the light of the combined teaching of D1 and D2 (Art. 33(3) PCT).

- 4.1 On the other hand, it has to be concluded that the amount of plasticizer is of minor importance and that the yellowing index predominantly depends on the appropriate choice of the surfactant.
- 4.2 Whether dioctyl sulfosuccinate is designated surfactant or bleaching compound as in present claims 2 and 4, respectively, or is denominated emulsifying agent as in the state of the art is immaterial.

The benefits resulting from the use of dioctyl sulfosuccinate during preparation of a PVB resin are already detailed in D3 - see column 2, lines 15 to 53, Summary of the Invention, in particular the last paragraph which mentions increased laminar and support strength, stiffness and transparency.

The decisive role of this surfactant - not anyone - in the PVB interlayer is a feature which is not reflected by the present independent claim(s).

The finding that the presence of dioctyl sulfosuccinate is capable of suppressing discoloration of PVB which is subjected to harsh processing conditions is regarded to be surprising and not to be derivable from the state of the art as documented by the international search report.

4.2 The method according to which the article of claim 8 is obtained is a conventional

one (cf. D4, p.17, II.3-24).

The subject-matter of claim 8 when taken alone is regarded not to involve an inventive step.

Miscellaneous

- 5.1 The disclosure of D1 and D2 has not been acknowledged in the description (Rule 5.1 (a) (ii) PCT).
- 5.2 Relative features such as "small laminate" and "high" curvature detract from clarity of claim 1 and the abbreviation "DOSS" should be avoided in the set of claims (Art. 6 PCT).
